                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to Immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E coli. Sequence AAQ51316 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino the coline of the coline of the protein and the mutagenic primer sequence used to introduce the preferred mutation. (Amino the coline of the coline of the protein and the coline of the coline of the preferred mutation.

                                                                                                                  and
```

The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected t site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51319 is a combination of the wild-type coding sequence and the mutagenic

                                                                                                                                                                                                                                                                                         Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51315 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino point of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino points)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   key Location/Qualifiers misc_difference 153..155

                                                                                                                                                                                                                                                                                                                                                                                                                                       The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51318 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51314 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).

                  The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51320 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               enterotoxigenic bacteria; vaccine; immunogenic detoxified LT-A; protomer A; site-directed mutagenesis; reduced toxicity; ADP-ribosyltransferase activity; ss.
                                                                                                                                                                                                                                                                                                                    Immunogenic detoxified mutant cholera toxin and heat labile toxin useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    217

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51324 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     enterotoxigenic bacteria; vaccine; immunogenic protomer A; site-directed mutagenesis; reduced ADP-ribosyltransferase activity; ss.

Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51321 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunogenic detoxified mutant cholera toxin and heat labile t - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli

Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51323 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).

seq_name:
                               The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected toxite-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51322 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino primer sequence used to introduce the preferred mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     689

                                                                                                                                                                                                                                                           This sequence encodes the A subunit of the cholera toxin (CT-A) of Vibrio cholerae. The sequence was published by Mekalanos et al., Nature 306, 551 (1983). Mutations at selected positions within this sequence have been found to reduce toxicity (see AAOS1327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against cholera.

immunise vertebrate subjects. The adjuvant has the ability to enhance the humoral and cell-mediated immune responses elicited by the antigen (e.g. by making the antigen more strongly immunogenic or necessitating fewer/lower antigen doses). It can be administered prior/subsequent to the antigen, and is preferably administered within a short space of time to the same site; it can also be administered in isolation from antigens as a boost following systemic or mucosal antigen administration. Most preferably, the adjuvant is co-administered with the antigen in the compositions and a pharmaceutically acceptable carrier. The antigen may be derived from viruses, bacteria, parasites and fungi or may be tumour antigens, self-antigens and allergens. The compositions are therefore useful in the treatment and prevention of e.g. viral diseases, allergic manifestations, diseases caused by pathogens (e.g. bacteria or parasites).
                                              Erythematosus), Alzheimer's disease and cancers. The adjuvant cabe used to prepare antibodies against selected antigen(s), useful e.g. for diagnostic purposes or for antigen purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    selected antigen and optionally a pharmaceutically acceptable (optionally topical) vehicle. The adjuvant composition can be administered parenterally in conjunction with at least one antigen in methods to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mutant detoxified form of this protein is used in a parenteral adjuvant composition, which comprises the detoxified protein, at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence corresponds to the coding region for the A subunit of cholera toxin, an example of a bacterial ADP-ribosylating toxin. A mutant detoxified form of this protein is used in a parenteral adjunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigen e.g. in disease treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detoxified mutants of bacterial ADP-ribosylating toxins as parenteral adjuvants - useful to enhance humoral and cell-mediated immune responses in vertebrates when administered with selected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                21-MAR-1997;

XX New polynucleotides encoding LT-A or CT-A polypeptides for the ransformation of plant cells, useful in immunogenic compositions to PT elicit immune responses in animals

XX Disclosure; Fig 4A; 103pp; English.

XX Conjuncted to CT, A subunit (CT-A), polypeptide or a mutant v. Cholerae cholera toxin (LT) compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide of turnber comprises a nucleic acid sequence encoding LT B subunit (CT-B). The polynucleotides are useful for the transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants to CT or the prophylactic or therapeutic treatment against E. coli or V. Cholerae. The mutant polypeptides are also useful as adjuvants.

XX Sequence 777 BP; 209 A; 174 C; 191 G; 203 T; 0 other;

The invention provides a chimeric molecule that comprises a first subunit which is mutated A subunit of first enterotoxin and a second non-mutated subunit from a second enterotoxin which is different from the natural enterotoxin which has been mutated to provide A subunit. A composition of matter comprising the chimeric molecule in a pharmaceutically acceptable carrier is useful for obtaining enhanced immune response of an organism to an antigen by administering it to the antigen. The chimeric molecule is useful to provide specific immune response to a particular enterotoxin, as adjuvants for use with unrelated vaccines, and to customize adjuvants to direct production of cell-mediated or humoral immuneity. The present sequence represents the DNA sequence cholera toxin A and B subunits.
                                                                                                                                                                                                                                                                                                                                               Chimeric molecule useful as adjuvant for cell-mediated/humoral immunity comprises first mutated A subunit of first enterotoxin and second non-mutated subunit from second enterotoxin different from natural

                                                                     alignment_scores:
                                                                                                                                          This plant-codon optimized cDNA encodes a mutant synthetic CC Vibrio cholerae cholera toxin (CT) A subunit (CT-A) having a A72R CC substitution. The sequence had no CG cryptic signal sequence and no CG (potential methylation sites) sequences. Novel polynucleotides encode a mutant Escherichia coli heat-labile toxin (LT) subunit A (LT-A) CC polypeptide or a mutant V. cholerae cholera toxin (CT) A subunit (CT-A) CC polypeptide, which have reduced enzyme activity as compared to the CC wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further CC comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of CC vaccines, especially oral vaccines in transgenic plants for the production of transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           seq_name: /SIDS5/gcgdata/geneseq/geneseqn-embl/NA2000.DAT:AAA51159

                                                                                               Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                     Hybrid molecules are produced by covalently linking (1) a portion (A) of the binding domain of a cell-binding ligand, allowing binding of the mol. to an animal cell; (2) a portion (B) of a translocation domain of a protein able to translocate (C) across the cell cytoplamic membrane, and and (3) a portion (C) which is to be introduced into the cell. (A) is derived from a steroid or polypeptide hormone, a single-chain analogue of a monoclonal antibody able to bind an antigen expressed on the cell surface, or a polypeptide toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hybrid; fusion; membrane translocation; binding region; HIV; infection; toxin; steroid; hormone; monoclonal antibody; antigen; diphtheria; exotoxin; phenylketonuria; cholera; interleukin; IL-2; protease; epidermal growth factor; ricin; tetanus; hexosaminidase; Shiga-like toxin A; ligand; insulin; nuclease; ss.
                                                                                                                                                                                                     Specified examples are CT-A/DT-B'/IL-2, SLTA/DT-B'/IL-2, ricin A/DT-B'/IL-2, hydroxylase-DT-B' or their biologically active mutants. (CT-A-cholera toxin, DT-B'-truncated diphtheria toxin, SLTA-Shiga-like toxin A; HIVP-BP-HIV protease binding
                                                                                                                                                                                                                                                                                         (A) may be derived from insulin, interleukins epidermal growth factor. Suitable enzymes in (C) include cholera toxin
                                                                                                                                                                                                                                                                                                                                           analogue of a monoclonal antibody on the cell surface, or a polypept (B) is derived from a toxin (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hybrid molecules for targetting chemical entity to cell - have membrane trans-locating and cell binding-regions and used to treat HIV infection, genetic enzyme-deficiency disorders etc.

                                                                                                                                                                                                                                                                              This sequence comprises the Vibrio cholerae gene that encodes cholera toxin (see AAW25785). DNA encoding an enzymatically active Al fragment of the cholera toxin was used to construct a cholera toxin Al-diphtheria toxin B'-interleukin-2 (CTA-DTB-IL2) gene that toxin Al-diphtheria toxin B'-interleukin-2 (CTA-DTB-IL2) gene that was expressed in E. coli. The hybrid protein can be isolated and used e.g. as an adjunct to treatment with DTB-IL2 hybrid, which targets the cell-killing ability of diphtheria toxin to cells bearing the IL2 receptor, such as certain leukaemic T cells. Prior application of the CTA-DTB-IL2 hybrid alleviates the problem of endogenous IL2 competing with DTB-IL2 hybrid for IL2 receptors on T cells. Claimed hybrid proteins comprise a translocation domain and a cell binding domain from e.g. a hormone, used for the delivery of agents (e.g. therapeutic genes, toxins, detectable labels) into cells. The use of a translocation mechanism ensures that the hybrid will be effective in relatively low doses, since a high proportion of the substance of interest will be taken into the targeted cells. The hybrid molecules can be manufactured as a single hybrid recombinant protein, permitting composition, consistency, and the precise control of

                                                                                                                                                                                                                                                                                                                                  The invention relates to a recombinant DNA molecule encoding a hybrid CC protein comprising three parts: (a) the first part comprises a portion CC of the binding domain of a cell-binding polypeptide ligand allowing the CC hybrid protein to bind to an animal cell; (b) the second part comprises CC selected from diphtheria toxin, botulinum neurotoxin, ricin, cholera CC toxin, rictaxin, c3 toxin, shiga-like toxin, pertussis toxin and tetanus CC toxin, which translocate the third part of the across the cytoplasmic CC membrane into the cytosol of the cell; and (c) the third part comprises CC a polypeptide entity to be introduced into the cell, which is non-native CC toxin and toxin protein of (b). This sequence represents the CC vibrio cholerae toxin Al fragment gene for use in generating the hybrid CC of the invention. The hybrid molecule enables the direction of CC appropriate therapy to affected cells, allowing them to function properly CC and alleviate or cure the disease. The hybrid is especially used in CC treating genetic deficiency diseases, by delivering to affected cells CC an enzyme supplying the missing function, to supplementing cellular CC levels of a particular enzyme or a scarce precursor or cofactor, to CC directing toxins or other poisons to destroy particular cells (such as CC adipocytes, cancer cell, or virus infected-cells), to counteracting viral CC cure in the such as HIV, by introducing appropriate antibodies to viral CC cubstances such as HIV, by introducing appropriate antibodies to viral CC cubstances such as detectable labels into cells.
                                                                                                                              Align seg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-JUN-1984;

The toxin can CC be included in the hybrid protein of the invention and used to destroy or CC modify the cell that the hybrid protein is trangeted to. The hybrid CC protein comprises a first part which is a portion of the binding domain CC of a cell-binding ligand, effective to cause the hybrid molecule to bind CC to a cell of an animal. The second part comprises a portion of a CC translocation domain of a naturally occurring protein (e.g. the CC translocation domain of diphtheria toxin) the second part translocates CC the third part across the cytoplasmic membrane and into the cytosol of CC the cell. The third part comprises a chemical entity to be introduced into the cell, where each of the first and third part is non-native with CC respect to naturally occurring protein, and the covalent bond attaching CC the second and third part is cleavable. The toxin encoded by the present CC ell binding domain binds to a specific cell membrane into the cytosol. CC The third part of the protein, linked to the translocation domain through a cleavable bond, can then carry out its function. The hybrid molecules are useful for treating genetic deficiency diseases by delivering to CC cellular levels of a particular enzyme or a scarce precursor or cofactor, to charter toxins or other noisons to destroy particular cells (such as

Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51328 is a combination of the wild-type coding sequence and the mutagenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunogenic detoxified mutant cholera toxin and heat labile toxin useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli

Certain mutations were found to reduce toxicity (see AAQ51327-051334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51334 is a combination of the wild-type coding sequence and the mutagenic

                                                                   CC This plant-codon optimized cDNA encodes a mutant synthetic Vibrio cholerae cholera toxin (CT) A submit (CT-A) having a 563K CC substitution. The sequence has no cryptic signal sequence and no CG (potential methylation sites) sequences. Novel polynucleotides encode a CC mutant Escherichia coli heat-labile toxin (LT) submnit A (LT-A) CC polypeptide or a mutant V. cholerae cholera toxin (CT) A submnit (CT-A) CC polypeptide, which have reduced enzyme activity as compared to the CC wild-type LT-A or CT-A polypeptide and where at least one of the codons C is altered to a plant preferred codon. The polynucleotide further CC comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible coronines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The coli mutant polypeptides are also useful as adjuvants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositions elicit immune responses in animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Plant-optimized mutant V.

                                                                                                                                                                                                                                                                                                                         The wild-type sequence coding for the A subunit of the cholera toxin (CT-A) (MeKalanos et al., Nature 306, 551 (1983) - see AAQ46318) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51332 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.

Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51329 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.

   The wild-type sequence coding for the A subunit of the cholera toxin (CT-A) (Mekalanos et al., Nature 306, 551 (1983) - see AAQ46318) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates
                                                                                                                                                                                                               Immunogenic detoxified mutant cholera toxin and heat labile toxin useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic detoxified CT-A; cholera vaccine; adenylate cyclase; protomer A; site-directed mutagenesis; reduced toxicity; ADP-ribosyltransferase activity; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      651
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             217

Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51327 is a combination of the wild-type coding sequence and the mutagenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic detoxified CT-A; cholera vaccine; adenylate cyclase; protomer A; site-directed mutagenesis; reduced toxicity; ADP-ribosyltransferase activity; ss.

Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51331 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.
                                                                                                                                                                                           101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-DEC-1991;

Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51330 is a combination of the wild-type coding sequence and the mutagenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                       134

This plant-codon optimized cDNA encodes a mutant synthetic Vibrio cholerae cholera toxin (CT) A subunit (CT-A) having a R192G substitution. The sequence has no cryptic signal sequence and no CG (potential methylation sites) sequences. Novel polynucleotides encode a mutant Escherichia coli heat-labile toxin (LT) subunit A (LT-A) polypeptide or a mutant V. cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   651
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        601
